The figure shows a step-by-step process:

- Initial State:** A control panel with a power button, a range selector set to 0, and two indicator lights labeled P0 and P1.
- Step 1:** An arrow points to the first of three identical engine units below the panel.
- Step 2:** The range selector is moved to 1. A "SET" button is pressed. The second engine unit is now active.
- Step 3:** The range selector is moved to 2. Another "SET" button is pressed. The third engine unit is now active.
- Step 4:** The range selector is moved to 3. A "+" button is pressed. All three engine units are now active.
- Step 5:** The range selector is moved back to 0. A "SET" button is pressed. This indicates that having 3 engines is the optimal configuration.
